

StatsBomb API Player Mapping Specification

v1.0.0

[StatsBomb API - last updated 5 Aug 2022]

This document describes the API used to request a listing of players for which the user has licensed access. Credentials need to be supplied as described in the general API notes.

Summary of Changes for v1.0.0

- Created Player Mapping API

Accessing the API

The updated API can be accessed by making a request to <https://data.statsbomb.com/api/v1/player-mapping> followed by one or more query parameters. If no query parameters are given, no data is returned.

There is a set of query parameters that filter the data down from all of those for which the user has access. These are:

Query Parameter	Type	Parameter Description
competition-id	integer	The desired competition id
season-id	integer	The desired season id
live-player-id	integer	The desired player id from the statsbomb live system. Note: only one of either live-player-id or offline-player-id may be specified, not both.
offline-player-id	integer	The desired player id from the offline statsbomb system. Note: only one of either live-player-id or offline-player-id may be specified, not both.
match-date-from	yyyy-mm-dd	Only competition-season-team blocks which contain matches played on or after this date will be retrieved. In yyyy-mm-dd format, e.g. 2020-12-31

match-date-to	yyyy-mm-dd	Only competition-season-team blocks that have matches played on or before this date will be retrieved. In yyyy-mm-dd format e.g. 2022-12-31. Note: if both match-date-from and match-date-to are specified then only competition-season-team blocks that have matches played between the two dates will be retrieved.
---------------	------------	---

There is also a set of query parameters to control the size and type of data returned.

Query Parameter	Type	Parameter Description
all-account-data	boolean	To ensure that a large amount of data is not returned whilst a user is trialing the endpoint, to return all of the player data available on a user's account, this flag must be set to true.
add-matches-played	boolean	To also return a collection of match ids where the player is listed in the match lineup, this flag must be set to true.

These query parameters can be combined to retrieve a smaller set of data than is available on the user's account. For example, if a user would like to retrieve player data from:

- the 2020/2021 season
- of the Women's Super League
- for Jill Scott
- including a list of the matches played in that season

the request would be:

<https://data.statsbomb.com/api/v1/player-mapping?season-id=90&competition-id=37&offline-player-id=10172&add-matches-played=true>

Response

The response will be in JSON format. **Note: if the query returns more than 5000 records, this will be streamed to file as JSON instead of being delivered as the response payload.** The response is an array of player-mapping, which have the following structure:

Variable	Variable Type	Variable Description
competiton_id	integer	The unique identifier for the competition
competition_name	string	The name of the competition
season_id	integer	The unique identifier of the season
season_name	string	The name of the season
offline_team_id	integer	The unique identifier of the team, in the standard Statsbomb offline system
live_team_id	integer	The unique identifier of the team, in the Statsbomb Live system
team_name	string	The name of the team
earliest_match_date	date, yyyy-mm-dd	The match date of the most pastwards match this player appeared in the lineup for this combination of {competition, season, team}
most_recent_match_date	date, yyyy-mm-dd	The match date of the most futurewards match this player appeared in the lineup for this combination of {competition, season, team}
offline_country_of_birth_id	integer	The unique identifier of the country of birth of the player, in the standard Statsbomb offline system
live_country_of_birth_id	integer	The unique identifier of the country of birth of the player, in the Statsbomb Live system
country_of_birth_name	string	The name of the player's country of birth
offline_player_id	integer	The unique identifier of the player, in the standard Statsbomb offline system
live_player_id	integer	The unique identifier of the player, in the Statsbomb Live system

player_name	string	The name of the player
player_nickname	string	The nickname of the player
player_height	number	The height of the player in cms
player_weight	number	The weight of the player in kg
player_birth_date	date, yyyy-mm-dd	The date of birth of the player
team_gender	string	The gender of competitions played by the team
player_preferred_foot	string	The recognised preferred foot of the player
matches_played	array	The matches that the player appeared in the match lineup for this combination of {competition, season, team}. Note: even if match-date-from and/or match-date-to filters were used, matches_played will always return all matches played in the competition-season-team block.

Matches_played objects have the following structure:

Variable	Type	Notes
offline_match_id	integer	The unique identifier of the match, in the standard Statsbomb offline system
live_match_id	integer	The unique identifier of the match, in the Statsbomb Live system
match_date	date, yyyy-mm-dd	The date the match was played

This is the data from the above example, showing Scott's mid-season transfer on loan from Manchester City to Everton in the 2020/2021 season:
